ABSTRACT
The purpose of this research is to show the effect of Financial Leverage, Firm Size, Basic Earning Power and Activity Ratio to Earning Per Share on manufactured companies automotive and components sub-sector that listed on Indonesian Stock Exchange period 2013 - 2017. Sampling is done by purposive sampling method. The population in this research were 13 companies and the sample used were 12 manufacturing companies of automotive and components sub sector that listed on Indonesian Stock Exchange period 2013-2017. The method used in this research is hypothesis testing method. The analytical tool used is multiple linear regression analysis tested by using Program SPSS version 20 and Microsoft Excel 2016. The data used is secondary data in the form of complete financial statements during research period. The result of this research shows that Financial Leverage, Firm Size and Basic Earning Power have an effect to Earning Per Share. While Activity Ratio has no effect to Earning Per Share.

INTRODUCTION
The automotive and component industries in Indonesia have developed into an important pillar in manufacturing sector in the country because many world-famous car companies have the manufacturing factories or even increasing their production capacity in Indonesia, a country with economy the largest in Southeast Asia as well as the countries with the largest population in Southeast Asia and the fourth position largest population in the world. This is interesting world companies, especially automotive and component companies to open factories in Indonesia. This is used as an opportunity for the company to develop its business.

Investors who will invest their funds will certainly do a certain analysis to assess whether the funds he will invest provide a favorable dividend at this time and in the future or not, an investor is not only attracted by the company's performance but...
also by the value of Earning Per Share produced by the company. Potential investors are attracted by large Earning Per Share and continue to increase every year, because Earning Per Share is one indicator of the success of a company. According to Salim (2014) Earning Per Share or earnings per share is the profit earned by each share. The higher value of Earning Per Share shows that the company is in a healthy condition and will be one of the factors that attract investors to invest their funds in the company.

There are many ways to develop business growth undertaken by automotive industries is to maximize funding sources. Sources of funding can be sought from internal funds and external funds, if internal funds are limited the company can look for alternatives additional from external funds by lending and selling shares in the capital market with attractive investor’s attention to buying shares circulated by the company. One indicator that makes investors interested to invest are the level of Earning Per Share of a company. Variables that can affect Earning Per Share refers to some previous research, which is Financial Leverage this research is calculated by Debt To Equity Ratio, Company Size, Basic Earning Power and Which activity ratio in this study is proxied by Total Assets Turnover.

LITERATURE REVIEW
Financial Leverage
According to Rodoni and Ali (2014) the Financial Leverage ratio or also called the debt ratio is a tool in considering the possibility of company negligence on debt contracts. Financial Ratio The leverage used is Debt To Equity Ratio. According to Harjadi (2015) the ratio of debt to Equity (Debt To Equity Ratio = DER) is a ratio that measures the extent of debt can be fulfilled by own capital. The formula is as follows:

\[
Debt\ to\ Equity\ Ratio = \frac{Total\ Debt}{Equity}
\]

Company Size
According to Jogiyanto (2017) the asset size variable is measured as the logarithm of the total assets. According to Rodoni and Ali (2014) the formula for calculating Company Size is as the following:

\[
Company\ Size = \ln (Total\ Asset)
\]

Basic Earning Power
According to Brigham and Houston (2010) the ratio of basic ability to generate profits (Basic Earning Power-BEP) is calculated by dividing the amount of profit before interest and taxes (EBIT) with total assets. The formula is as follows:

\[
Basic\ Earning\ Power = \frac{EBIT}{Total\ Assets}
\]

Activity Ratio
According to Rodoni and Ali (2014) the activity ratio shows how effective the company is use the resources (assets or capital) it has. The ratio of activities used in This research is Total Assets Turnover, a ratio that measures the efficiency of asset use to generate sales. The formula is as follows:

\[
Total\ Assets\ Turnover = \frac{Sales}{Total\ Assets}
\]

Earning Per Share
According to Harjadi (2015) Earning Per Share (EPS) is a ratio that shows the share of earnings of for each share. So EPS illustrates the profitability of the company illustrated in each share. EPS can be calculated by the formula:

\[
Earning\ Per\ Share = \frac{Net\ Profit}{Number\ of\ Shares\ Outstanding}
\]

Research Framework

[Diagram showing the relationship between Debt To Equity Ratio, Company Size, Basic Earning Power, Total Assets Turnover, and Earning Per Share.]
RESEARCH METHODS

Research Population
In this study the population used was 13 automotive subsector manufacturing companies and components listed on the Indonesia Stock Exchange for the period 2013-2017.

Research Samples
Purposive sampling technique used in this study. Company automotive sub-sector manufacturing and components during the 2013-2017 research period streaks are listed on the Indonesia Stock Exchange and in that period always publishes reports Complete financial, audited, widely publicized. Amounts that meet the criteria There are 12 of 13 companies.

Research model
Hypothesis testing is a research model used in this study, which is related with the influence of Financial Leverage, Company Size, Basic Earning Power, and Activity Ratio against Earning Per Share is to use multiple linear regression. The multiple linear regression equation in this study is as follows:

\[ Y = a + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + e \]

\[ \text{Y} = \text{Dependent variable predicted} \]
\[ a = \text{constant} \]
\[ b = \text{Regression coefficient} \]
\[ X_1, X_2, X_3, X_4 = \text{Value of independent variables} \]
\[ e = \text{error} \]

Multiple Linear Regression Analysis
The regression coefficient of the Earning Per Share variable is influenced by the variable Debt To Equity Ratio (Financial Leverage), Company Size and Basic Earning Power so that the regression equation is obtained as follows:

\[ \text{LN_EPS} = -0.286 - 0.734 \text{LN_DER} + 0.232 \text{LN_UP} + 0.928 \text{LN_BEP} \]

Can be interpreted based on the multiple linear regression equation above, which is as follows:
1. Constant -0.286, this means that if the Debt To Equity Ratio (LN_DER), Company Size (LN_UP) and Basic Earning Power (LN_BEP) are 0, the Earning Per Share is -0.286.
2. Debt To Equity Ratio (LN_DER) regression coefficient of -0.734, which means that if Debt To Equity Ratio increases by 1 unit then Company Size (LN_UP) and Basic Earning Power (LN_BEP) are fixed, then Earning Per Share will decrease in the amount of 0.734 units.

Negative coefficient means that there is a negative influence between the independent variable and the dependent variable, the higher the Debt To Equity Ratio, the lower the Earning Per Share, and vice versa.

3. Firm size variable regression coefficient (LN_UP) of 0.232, which means if the Company Size has increased by 1 unit then Debt To Equity Ratio (LN_DER) and Basic Earning Power (LN_BEP) are fixed, then Earning Per Share will increase by 0.232 units. Positive coefficient means that there is a positive influence between the independent variable and the dependent variable, the higher the Company Size, the higher the Earning Per Share, and vice versa.

4. The regression coefficient of the variable Basic Earning Power (LN_BEP) is 0.928, which means that if Basic Earning Power has increased by 1 unit then Debt To Equity Ratio (LN_DER) and Debt To Equity Ratio (LN_DER) has a fixed value, then Earning Per Share will increase by 0.928 units. Positive coefficient means that there is a positive influence between the independent variable and the dependent variable, the higher the Basic Earning Power, the higher the Earning Per Share, and vice versa.

RESULTS AND DISCUSSION

Effect of Financial Leverage on Earning Per Share
According to Rodoni and Ali (2014) the ratio of Financial Leverage or also called the debt ratio is a tool in considering the possibility of company default on debt contracts. The Financial Leverage Ratio used is Debt To Equity Ratio. In this study Debt To Equity Ratio has a negative effect on Earning Per Share, it can be explained that if Debt To Equity Ratio increases, Earning Per Share will decrease. The results of this study are consistent
with Anwar's (2017) study which states that Debt To Equity Ratio has a significant effect on Earning Per Share.

Effect of Company Size on Earning Per Share
According to Sartono (2016) large companies that have Well-Established will be easier to obtain capital in the capital market compared to small companies. Because the ease of access means that large companies have greater flexibility as well. In the study of company size has a positive effect on earnings per share, it can be explained that if the size of the company increases, the earning per share will increase. The results of this study are in line with the study of Mudjijah (2015) which states that company size has a positive and significant effect on earnings per share.

Effect of Basic Earning Power on Earning Per Share
According to Brigham and Houston, the result of the translation of Ali Akbar Yulianto (2010) the ratio of the basic ability to generate profits (Basic Earning Power-BEP) is calculated by dividing total profit before interest and tax (EBIT) with total assets. In this study Basic Earning Power has a positive effect on Earning Per Share, it can be explained that if Basic Earning Power increases, Earning per Share will increase. The results of this study are in line with research Zamri, Purwati, and Sudjono (2016) which states that Basic Earning Power has a positive and significant effect on Earning Per Share.

Effect of Activity Ratio on Earning Per Share
According to Rodoni and Ali (2014) the activity ratio shows how effectively a company uses its resources (assets or capital). Use of company resources to generate sales. The activity ratio used is Total Assets Turnover, which is a ratio that measures the efficiency of using assets to generate sales.

In this study, Total Asset Turnover has no effect on Earning Per Share, this shows that the high and low of Total Asset Turnover does not affect Earning Per Share. The results of this study are consistent with Kusuma's (2014) study which states that Total Asset Turnover has no effect on earnings per share.

CONCLUSION
Based on these results, the conclusion is that Financial Leverage, Company Size and Basic Earning Power affect Earning Per Share while the Activity Ratio has no effect on Earning Per Share in the automotive subsector and component manufacturing companies listed on the Indonesia Stock Exchange for the period 2013-2017.

The results of this study can be implicated for companies and investors, namely: for companies, it is expected to pay attention to factors that influence the ups and downs of Earning Per Share, such as Financial Leverage, Company Size and Basic Earning Power. But it also needs to pay attention to factors that do not affect Earning Per Share such as Activity Ratio because the management of assets by the company is less than optimal so the Activity Ratio does not affect Earning Per Share. Investors are expected to be considered by investors to make appropriate and profitable investments by looking at ratios that can affect earnings per share.
